

Presentation

Select the survey method
and prepare the semi-structured interview

Lesson 3

"From calibration to the relevant units"

Objectives of the lesson:

- Build a sample,
- Adjust according to the resources available,
- Understand the importance of triangulation - iteration - saturation.

Summary of the theoretical content

To select pertinent units, the problem statement question and the variables must already have been identified. It is by passing through these different stages that the sample can be built.

Lesson Plan

- 1) Familiarize yourself with Nicole SIBELET's lesson on theory.
- 2) Consult the West/South Sumatra case study presented by Madeleine MUTEL. The case study illustrates how to combine several data collection methods and the difficulty of defining a survey unit.
- 3) Read the instructions of exercise 1 and do the exercise:
 - a. Using the Mali case study, you are going to investigate variables
 - b. Consult the model answer provided (text).

Estimated duration of this lesson is: 2.5 hours

☞ You may now familiarize yourself with the theory section of this lesson.
